SYSTEMS OF UNITS.

The numerical value of a concrete quantity is expressed by stating how many units, or what part or parts of a unit, the quantity contains. Thus, weight is expressed by the number of pounds, length by the number of feet, etc. The quantity which may be chosen for a unit is quite arbitrary, but convenience is gained by establishing certain relations between the adopted units. **Fundamental units** are chosen arbitrarily; **derived units** are defined in terms of fundamental units. In physics the fundamental units generally adopted are those of *length, mass,* and *time.* Reference of all units to these three is made possible by the establishment of Newton's laws of motion. (See MOTION.) The magnitudes of units vary with those of the fundamental units by which they are defined. The *dimensions* of a unit are expressed by giving in terms of the fundamental units the ratio in which they are increased by increase in those units. These dimensions are expressed by calling the units of length, mass, and time L, M, and T, respectively. Thus, velocity has the dimensions $\frac{L}{T}$ or LT^{-1}, which means that if the unit of length be doubled, the unit of velocity based on it is also doubled, while if the unit of time be doubled, the corresponding unit of velocity will be halved.

FUNDAMENTAL UNITS.

The standard unit of length in Great Britain is the *yard;* in France, the *meter.* The legal standard of mass in Great Britain is the imperial *pound* avoirdupois; in France it is the *kilogram.* The universal unit of time is the *second.* A system of derived units may be based on any three of these or multiples or submultiples of them, properly selected, as the foot, pound, and second. The *centimeter-gram-second system,* commonly called the *C. G. S. system,* based upon the centimeter, the gram, and the second as the fundamental units, was established by the British Association in 1861.

DERIVED UNITS.

In the mechanics of engineering, the fundamental units adopted are *length, time,* and *force* (as indicated by a spring balance). Mass is considered a derived unit established as

follows: the units for *velocity* and *acceleration* are defined, as in physics, from the fundamental units for *length* and *time*. Unit *mass* is then defined by the relation: force = mass × acceleration, force being fundamental.

Electrical units are either *electrostatic* or *electromagnetic*. The **electrostatic units** are developed from the definition of unit quantity of electricity based upon the law of attraction and repulsion established by Coulomb. **Electromagnetic units** are similarly based upon the definition of unit pole. Corresponding units have different values and dimensions in the two systems. All electrical units may be defined in either system. The *electrostatic definitions* are as follows: **unit quantity of electricity**, that quantity which acts with unit force upon an equal quantity at unit distance in the C. G. S. electrostatic system it is the quantity that repels an equal similar quantity, at the distance of 1 centimeter, with the force of 1 dyne; **u. of surface density**, the density when unit surface contains unit quantity of electricity; **u. of volume density**, the density when unit volume contains unit of electricity; **u. intensity of electrostatic field**, the field in which unit quantity of electricity is acted upon with unit force; **u. of difference of potential** between two points, a difference such that unit work is generated or expended in moving unit quantity from one to the other; **u. current**, a current such that unit quantity of electricity flows in unit time; **u. resistance**, a resistance allowing unit current to flow when subjected to unit difference of potential; **u. capacity**, a capacity charged to unit potential by unit quantity of electricity; **u. specific inductive capacity**, the specific inductive capacity of air. See CAPACITY.

The *electromagnetic definitions* are as follows: **u. magnetic pole** (*m*), a magnetic pole which acts with unit force upon another equal pole at unit distance in the C. G. S. electromagnetic system it is the pole that repels an equal similar pole, at the distance of 1 centimeter, with the force of 1 dyne; **u. intensity of magnetic field** ($\mathfrak{H}$), that field in which unit pole is acted upon by unit force; **u. magnetic moment**, a magnetic moment equal to that of a positive unit pole at unit distance from a negative unit pole, or, more strictly, the moment of a magnet that experiences unit couple when placed perpendicular to the lines of force in unit field; **u. current**, a current which, flowing in a circle of unit radius, will produce a magnetic field of intensity 2π at the center of the circle; **u. intensity of magnetization** ($\mathfrak{I}$), the intensity of magnetization corresponding to unit magnetic moment per unit volume; **u. magnetic difference of potential**, a difference between two points such that unit work is generated or expended in moving unit pole from one to the other; **u. magnetizing force** ($\mathfrak{H}$), a magnetizing force that produces unit magnetic field; produced by 10 ÷ 4π approximately (0.7958) ampere-turns per unit length (that is, by unit magnetomotive force per unit length); **u. susceptibility** (κ), the susceptibility of a substance which acquires unit intensity of magnetization when subjected to unit magnetizing force; **u. magnetic induction** (flux-density) ($\mathfrak{B}$), the induction produced in a non-magnetic substance, as air (permeability = 1), when subjected to unit magnetizing force; conventionally termed an induction of *one line* (of induction or flux) per square centimeter (see GAUSS, below); **u. magnetic flux** (N), a line of induction or flux (see WEBER, below), the magnetic flux through an area whose product by the magnetic induction is numerically equal to unity; **u. permeability** (μ), the permeability of air (in which unit magnetic induction is caused by unit magnetizing force); **u. magnetic reluctance** ($\mathfrak{R}$), the reluctance of a magnetic circuit of unit length, unit area, and unit permeability; a reluctance such that unit magnetomotive force will produce unit magnetic flux (see OERSTED, below); **u. magnetomotive force** (M.M.F.), a magnetomotive force producing unit magnetic flux through a magnetic circuit with unit reluctance; a magnetomotive force producing unit magnetizing force through unit length of magnetic circuit (see GILBERT, below); **u. electromotive force** (E.M.F.), the electromotive force in a circuit which does unit work in unit time when the unit current is flowing; the E.M.F. produced in a circuit in which there is unit change in the magnetic flux in unit time; **u. resistance**, the resistance of a circuit in which unit electromotive force produces unit current; **u. of self-induction** or **of mutual induction**, a coefficient of induction such that unit electromotive force is induced when the inducing current is changing at the rate of one unit in unit time.

The electrical units with their relations and their dimensions according to both the electrostatic and the electromagnetic systems, are shown in the large table in the second column.

Practical units of convenient magnitude were established by the Electrical Congress, Paris, 1881. The ratio of a practical unit to the corresponding unit in the C. G. S. electromagnetic system is some multiple of 10, as given in the table below. The practical units constitute a system derived from a fundamental unit of length of 10^9 centimeters (an earth-quadrant), a unit of mass of 10^{-11} grams, and a unit of time of one second. Since the units in any rational system are so related that a formula expressing a physical law will hold true for any such system if true for one, any such law, as Ohm's law that the current is equal to the electromotive force divided by the resistance, holds equally true for C. G. S. and practical units. Thus, practical units may be substituted in any one of the defining equations in the large table. For instance, the capacity of a condenser expressed in farads is equal to the quantity of electricity in coulombs divided by the electromotive force in volts, and similar relations hold for the other units. The practical units, as defined by the International Congress of Electricians (Chicago, 1893), are as follows: **u. of resistance**, the *international ohm*, represented by the resistance offered to an unvarying electric current at the temperature of melting ice by a column of mercury 14.4521 grams in mass, of a constant cross-sectional area, and 106.3 centimeters long; **u. of current**, the *international ampere*, represented by the unvarying current which, when passed through a solution of nitrate of silver in water, in accordance with certain specifications, deposits silver at the rate of 0.00111 of a gram per second; **u. of electromotive force**, the *international volt*, the electromotive force that, steadily applied to a conductor whose resistance is one international ohm, will produce a current of one international ampere; represented by $^{1000}/_{1434}$ of the electromotive force between the electrodes of Clark's voltaic cell, at a temperature of 15° C.; **u. of quantity**, the *international coulomb*, the quantity of electricity transferred by a current of one international ampere in one second; **u. of capacity**, the *international farad*, the capacity of a condenser charged to a potential of one international volt by one international coulomb; **u. of work**, the *joule*, represented by the energy expended in one second by an international ampere in an international ohm; **u. of power**, the *watt*, represented by the work done at the rate of one joule per second; **u. of induction**, the *henry*, the induction in a circuit when the electromotive force induced in this circuit is one international volt, while the inducing current varies at the rate of one ampere per second. The relations between these units and the C. G. S. units are as follows:

The **magnetic units** of the *practical system* are not used on account of their inconvenient magnitudes. The C. G. S. units for these quantities are accordingly used and are commonly designated simply as C. G. S. units. The following names for these magnetic units have been adopted by the American Institute of Electrical Engineers (1894).

Universities arose in Europe in the middle ages, and were at first essentially ecclesiastic. Their functions gradually became specialized, some dividing into several *faculties*, each of which took charge of some one great branch of instruction, as now in Germany, or into *colleges*, subordinate teaching bodies, as now in the large English universities, where the relation of the university to the college is similar to that of a federal government to its component states. In the United States the word has been used loosely, and many institutions that are nominally universities have a standard lower than that of others called colleges; but there is a general tendency to restrict the word to institutions offering non-professional instruction beyond the bachelor's degree, and having affiliated professional schools. Compare COLLEGE.

u're-a, yū'rę-ą *or* ū're-ą, *n. Chem.* A very soluble colorless crystalline compound (COH_4N_2) contained abundantly in the urine of mammals, and in small quantities in their various organs and in their blood and other fluids. Urea is also found in slight proportions in the excrement of birds, fishes, and reptiles. It is formed by the oxidation of nitrogenous compounds in the body, or is taken as food. A man of average weight eliminates during twenty-four hours about an ounce of urea, which is increased by excessive muscular exercise or abnormal nitrogenized diet. Urea has a toxic effect on the system when retained or when administered. Chemically, it is a diamid. It may be made synthetically by the reaction of potassium cyanate with ammonium sulfate. This synthesis, made by Wöhler in 1828, was the first artificial preparation of an organic compound, a process until then considered an impossibility, and thus began a new era in the development of that branch of organic chemistry. The normal urine of man has a specific gravity of 1.015 to 1.030, and the quantity voided in 24 hours is about 50 ounces, including nearly 2 ounces of solids. u'til-i"sa-ble, etc. Same as UTILIZABLE, etc.

u-til"i-ta'ri-an, yu-til"i-tê'ri-ən, *a.* **1.** Relating to, based upon, or consisting in utility; especially, placing utility above beauty or the amenities of life; sometimes, reprehensibly, regarding only a lower form of utility; evincing a selfish and sordid spirit; as, stock-speculation is essentially *utilitarian*.

The roses and clematis are rooted up, like our hopes. The *utilitarian* axe has been laid at the root of every tree. FANNY FERN *Fern Leaves, Old House* in first series, p. 245. [D. M. & CO. '53.]

2. Of, pertaining to, or advocating utilitarianism; as, the *utilitarian* philosophy.

According to this *utilitarian* doctrine, self-interest is the basis of social and political morality. . . . Every man is a supreme law to himself. BARING-GOULD *Origin of Religious Belief* pt. ii, ch. 4, p. 58. [A. '70.]

u-til"i-ta'ri-an, *n.* One devoted to mere utility or material interests; in philosophy, one who advocates utilitarianism.

Mr. Lecky has justly remarked that the only charge *utilitarians* can bring against vice is that of imprudence.
W. S. LILLY *On Right and Wrong* ch. 2, p. 48. [C. & H. '90.]

u-til"i-ta'ri-an-ism, *n.* **1.** *Philos.* The general theory that makes utility of some kind the end and criterion of action. Specifically: (1) The ethical doctrine that actions are right because they are useful or of beneficial tendency, and that utility is the supreme end of moral action. Such actions have been held to be virtuous, whether prompted by self-love, by benevolence, or partly by both; whether having reference to this life only or to a future state also; and whether the utility is confined to happiness (pleasure and freedom from pain) as the only thing desirable, or extended to higher forms of advantage or non-moral good. Compare EUDEMONISM; EUTHUMISM; GOOD; CHIEF GOOD.

(2) The ethical theory that makes the happiness of mankind the end of human conduct and the criterion of right. The word was coined by John Stuart Mill to express this view. (3) The doctrine, in civics and politics, that the greatest happiness of the greatest number should be the sole end and criterion of all public action. Compare BENTHAMISM. **2.** Devotion to mere material interests and aims.

Whatever shows that a greater happiness is to be found in immaterial things tends to stifle the *utilitarianism* which is the cause of growing paralysis of American life.
W. J. STILLMAN in *Atlantic Monthly* Nov., '91, p. 694.

u-til"i-ta'ri-an-ize, *vt.* [-IZED; -I"ZING.] [Rare.] To use with utilitarian intent; render utilitarian.

u-til'i-ty, yu til'i-ti, *n.* [-TIES, *pl.*] **1.** The quality, character, or state of being useful or serviceable; fitness for some desirable practical purpose; serviceableness; usefulness; also, that which is serviceable or useful.

Two words form the key of the Baconian doctrine — *utility* and progress. The ancient philosophy disdained to be useful, and was content to be stationary.
MACAULAY *Essays, Lord Bacon* p. 271. [A. '80.]

2. *Polit. Econ. & Ethics.* Fitness to supply the natural needs of man, or the quality of contributing to his comfort, prosperity, and happiness; that serviceableness which is the basis of the value of a thing.

Utility . . . includes not only the power to satisfy want, to give pleasure, to procure a good or ward off an evil, but to serve any purpose of man, society, or the state, in the present or coming time. *Utility* must often pass through several steps before it reaches a human desire.
J. M. GREGORY *Polit. Economy* ch. 2, p. 33. [V. A. B.]

3. *Philos.* (1) Happiness; the happiness of mankind; the greatest happiness of the greatest number. (2) Utilitarianism: still widely used, but exclusively used before Mill's coinage of the word *utilitarianism* and its adoption in literature.

The fundamental objection to the doctrine of *utility* in all its modifications, is that taken by Dr. Reid, viz., 'that agreeableness and *utility* are not moral conceptions, nor have they any connection with morality. What a man does, merely because it is agreeable, is not virtue.'
K.-F. *Vocab. Philos.* p. 346. [H. & CO. '78.]

4. *Theat.* (1) The actor to whom are assigned the smallest speaking parts in any line of business. Called also *utility-man*. (2) The part so assigned, or such parts collectively. **5**†. Use; profit. [< F. *utilité*, < L. *utilitas*, < *utilis*, useful, < *utor*, use.]

Synonyms: advantage, advantageousness, avail, benefit, expediency, profit, service, serviceableness, use, usefulness. *Utility* is somewhat more abstract and philosophical than *usefulness* or *use*, and is often employed to denote adaptation to produce a valuable result, while *usefulness* denotes the actual production of such result. We contrast beauty and *utility*. We say of an invention, its *utility* is questionable, or, on the other hand, its *usefulness* has been proved by ample trial, or I have found it of *use*; still, *utility* and *usefulness* are frequently interchanged. *Expediency* (literally, the getting the foot out) refers primarily to escape from or avoidance of some difficulty or trouble; either *expediency* or *utility* may be used to signify *profit* or *advantage* considered apart from right as the ground of moral obligation, or of actions that have a moral character. *Expediency* denoting immediate *advantage*, on a contracted view, and especially with reference to avoiding danger, difficulty, or loss, while *utility* may be so broadened as to cover all existence through all time, as in the utilitarian theory of morals. *Policy* is often used in a kindred sense, more positive than *expediency* but narrower than *utility*, as in the proverb, "Honesty is the best *policy*." See ADVANTAGE; PROFIT.—**Antonyms**: disadvantage, folly, futility, impolicy, inadequacy, inexpedience, inutility, unprofitableness, uselessness, worthlessness.

u'til-ize, yû'til-aiz, *vt.* [-IZED; -I"ZING.] To turn to practical account; make (something) profitable or serviceable by applying (it) to some use; improve.

Roman.	Black Letter.	Script.

V[1], **v,** vī, *n.* [VEES, V's, or *Vs*, vīz, *pl.*] **1.** A letter: the twenty-second in the English alphabet; in Bell's "Visible Speech," **3**: a sign of labiodental closure, the raising of the lower lip to the upper teeth, as in *av*, or a similar opening, as in *va;* the vocal cords being close so as to vibrate, and the nasal veil closed. It is a continuous consonant, a fricative, a sonant.

Similar movements with parted cords give *af, fa*, so that *v* and *f* easily interchange by surd and sonant assimilation, as in Greek *au, eu, ēu, ōu*, pronounced in modern Greek *av, ev*, etc., before sonants, *af, ef*, etc., before surds; so also in dialectic shiftings; southern English dialects have *v* for northern and middle *f*:

"I niver shell *vorget*
I *vust* drawd breath in Zummerzet."

The early *v*'s from Latin and Scandinavian are mostly shiftings from the semi-vowel *u* = *w;* a later group are sounds of early *b*, as in modern Greek and Spanish. ♦ In Anglo-Saxon the sound *v* is denoted by the same sign as *f*, or sometimes as *u;* in middle English *u* or *v* is generally used.

Nearly all the *v*'s in modern English in words from Anglo-Saxon are from *f*'s made sonant by coming between two sonants, as in *leaf* > *leaves, half* > *halves*, and *v* is never permitted to stand final. It would have been ambiguous when written *u: han* would have been a dubious *have*, and the rule survives its reason; reformers write *hav, liv*, etc.

Most English *v*'s, especially initial *v*'s, are in words from French and Latin; occasionally one comes from *f* and the other kindred letters: *vixen* < *fox, vial* < *phial*, so French *avoir* < *habere*, German *vater* < Parent Speech *pater*.

V is, after *m*, the most frequent of the labial sounds, and averages 2.37 per cent. of all the sounds in English literature according to Professor Whitney's examination. W. D. WHITNEY *Oriental and Linguistic Studies* second series, p. 274. [S. '74.]

Capital V is a Latin letter, a graphic variation of U, better suited to the chisel < early Greek ϒ Ƴ < Phenician ϒ < Egyptian hieratic < hieroglyphic  , an asp, from which also come F. Y. W. The characters V U, v u meant the same sound in Latin, Norman-French, and English as late as the Elizabethan period. They were counted as one in alphabetic arrangements until lately, like *I i* and *J j*.

The name *ve, vee*, French *vé*, is a modern formation in analogy with the Latin names of *b, c, d, g, p, t*. I was commonly called "single *u*," as *w* was "double *u*," so late as 1617. The German name *vau* is like the Phenician. For lower case, black letter, dates, etc., see F and U.

The calculus of vectors was first fully developed in quaternions (see QUATERNION), but the conception of the quaternion is not necessary to it. Every quaternion has a scalar part and a vector part; and the vector part is denoted by prefixing the letter V to the sign of the quaternion, as Vq. In other systems of vector analysis vectors are denoted generally by Greek or German letters.

[< L. *veneratus*, pp. of *veneror*, revere.]

Synonyms: adore, honor, respect, revere, reverence. In the highest sense, to *revere* or *reverence* is to hold in mingled love and honor with something of sacred fear, as for that which while lovely is sublimely exalted and brings upon us by contrast a sense of our unworthiness or inferiority; to *revere* is a wholly spiritual act; to *reverence* is often, though not necessarily, to give outward expression to the reverential feeling; we *revere* or *reverence* the divine majesty. *Revere* is a stronger word than *reverence* or *venerate*. To *venerate* is to hold in exalted honor without fear, and is applied to objects less removed from ourselves than those we *revere*, being said especially of aged persons, of places or objects having sacred associations, and of abstractions; we *venerate* an aged pastor, the dust of heroes or martyrs, lofty virtue or self-sacrifice, or some great cause, as that of civil or religious liberty; we do not *venerate* God, but *revere* or *reverence* him. We *adore* with a humble yet free outflowing of soul. See ADMIRE; DEFER.—Antonyms: contemn, despise, disdain, dishonor, disregard, scoff at, scorn, slight, spurn.

2. *Phren.* The faculty that leads to reverence for whatever is supreme, dignified, eminent, or great. **3.** [Rare.] The act of worshiping; worship. [OF., < L. *veneratio(n-)*, < *veneror*, revere.]

Synonyms: adoration, awe, dread, reverence. *Awe* is inspired by that in which there is sublimity or majesty so overwhelming as to awaken a feeling akin to fear; in *awe*, considered by itself, there is no element of esteem or affection, though the sense of vastness, power, or grandeur in the object is always present. *Dread* is a shrinking apprehension or expectation of possible harm awakened by any one of many objects or causes, from that which is overwhelmingly vast and mighty to that which is productive of momentary physical pain; in its higher uses *dread* approaches the meaning of *awe*, but with more of chilliness and cowering, and without that subjection of soul to the grandeur and worthiness of the object that is involved in *awe*. *Awe* is preoccupied with the object that inspires it; *dread* with apprehension of personal consequences. *Reverence* and *veneration* are less overwhelming than *awe* or *dread*, and suggest something of esteem, affection, and personal nearness. We may feel *awe* of that which we can not reverence, as a grandly terrible ocean storm; *awe* of the divine presence is more distant and less trustful than *reverence*. *Veneration* is commonly applied to things which are not subjects of *awe*. *Adoration*, in its full sense, is loftier than *veneration*, less restrained and awed than *reverence*, and with more of the spirit of direct, active, and joyful worship. See REVERENCE. Compare VENERATE.—Antonyms: contempt, disdain, dishonor, disregard, scorn.

Verbs may be classified with regard to their use with or without a grammatical object, as, (1) **transitive,** including *reflexive* and *reciprocal*, and having in general two voices, *active* and *passive*, and (2) **intransitive.** With regard to the expression of action or state they are either (1) **active** or (2) **neuter;** and with regard to the subject they are either (1) **personal** or (2) **impersonal.** According to their special import they also include the classes of **desideratives, frequentatives,** or **iteratives,** and **inchoatives.** See these words.

We must regard the *verbs* — always excepting the symbolic *verbs*, that is, *verbs* which in whole or in part have shed their old nounal coat — simply as nouns raised to an official position in the mechanism of the sentence, and qualified for their office by receiving a predicative power.
EARLE *Philol. Eng. Tongue* ch. 7, p. 295. [CL. P. '73.]

2†. A word. [< F. *verbe*, < L. *verbum*, word.]

— **irregular verb** (*Gram.*), a verb showing any departures from rule in inflection, as in abnormal endings or alteration of stem. Specifically, in English: (1) A strong verb; a verb forming its preterit by vowel-change (as *give, gave; fly, flew*), and its past participle by *en* or *n* (as *given; bitten; flown*). (2) A verb (like *have, sell, seek, cast, feed, set*, etc.) showing certain irregularities in past tense or past participles. — **regular v.** (*Gram.*), a verb following rule in inflection; specifically, in English, a verb forming its preterit and past participle in *-ed* or *-d*; as, *loved; walked*. This *-d* often changes to *t*, as *built*. — **strong-weak v.** (*Eng. & Ger. Gram.*), a verb showing both vowel-change and weak ending (as English *bring, brought;* German *bringen, brachte*). — **substantive v.** (*Gram.*), the verb *to be*. — **v. phrase** (*Engl. ver'bal, vęr'bal, *a.* **1.** Of, pertaining to, or connected with words; concerned with words rather than the ideas they convey; as, *verbal* distinctions; *verbal* criticism.

If all the general words of a language had a precise meaning, and were perfectly understood, as mathematical terms are, all *verbal* disputes would be at an end. THOMAS REID *Powers of Human Mind* vol. ii, essay iv, ch. 1, p. 19. [B. & BR. '63.]

Verbose. [F., < LL. *verbalis*, < L. *verbum*, word.]

Synonyms: literal, oral, vocal. These words, whose etymology would make them similar in meaning, are differentiated in usage by their applications. *Oral* applies to that which is given by spoken words in distinction from that which is written or printed; as, *oral* tradition; an *oral* examination. By this rule we should in strictness speak of an *oral* contract or an *oral* message, but *verbal* contract and *verbal* message, as indicating that which is by spoken rather than by written word, have become so fixed in the language that they can probably never be changed; this usage is also in line with other idioms of the language; as, "I give you my *word*"; "a true man's *word* is as good as his bond"; "by *word* of mouth," etc. A *verbal* translation may be *oral* or written, so that it is word for word; a *literal* translation follows the construction and idiom of the original as well as the words; thus a *literal* translation is more than one that is merely *verbal;* both *verbal* and *literal* are opposed to *free*. In the same sense, of attending to words only, we speak of *verbal* criticism, a *verbal* change. *Vocal* has primary reference to the human voice; as, *vocal* sounds, *vocal* music; *vocal* may be applied within certain limits to inarticulate sounds given forth by other animals than man; as, the woods were *vocal* with the songs of birds; *oral* is never so applied, but is limited to articulate utterance regarded as having a definite meaning; as, an *oral* statement.

1. A lumbar vertebra. 2. A thoracic vertebra. 3. A cervical vertebra. *a*, body; *b*, vertebral foramen, surrounded by pedicles (*c*) and the laminæ (*d*) forming the neural arch; *e*, the spinous process; *f*, a transverse process; *g*, an articular process; *h*, costal facet.

A typical vertebra consists of a more or less cylindrical solid piece of bone, the *body* or *centrum*, from whose dorsal surface a process arises on each side and meets in the middle line above, forming an arch (the *neural arch*) enclosing a space (the *neural canal*) through which passes the spinal cord. There are two median unpaired processes—the *spinous process*, *neural spine*, or *neurapophysis*, borne on the upper surface of the arch, and the *hemapophysis*, less frequently found, on the lower surface of the centrum. The paired processes are the articular or *zygapophyses*, rising from the anterior (*prezygapophyses*) or posterior (*postzygapophyses*) edges of the base of the neural arch, and the transverse, of which there may be two pairs, superior (*diapophyses*) and inferior (*parapophyses*). Additional processes also found are the *anapophyses* and *metapophyses*. In vertebrates with well-developed limbs the vertebræ anterior to those that bear ribs connecting with the sternum are **cervical**, those that bear ribs and succeed the cervicals are **dorsal** or **thoracic**, those anterior to the sacrum and bearing no movable ribs are **lumbar**, the one or more that coalesce to form the sacrum are **sacral**, and the succeeding ones are **caudal** or **coccygeal**. In man there are 7 cervical (the usual number in mammals), 12 dorsal, 5 lumbar, 5 sacral, and usually 4, sometimes 5, and less frequently 3 coccygeal.

2. One of the segmented portions of the entire axial skeleton. In this sense vertebræ may be segments of the cranium, and include not only the vertebræ proper, but the ribs, costal cartilages, and segments of the sternum or sternebers. **3.** *Echin.* One of the axial ossicles of the arms of a starfish or ophiuran. Although in the United States *veto* is applied as a common term to the constitutional power of the President to refuse his assent to an act of Congress, the word itself is unknown to the Constitution. A vetoed bill may be passed by a two-thirds vote of each house of Congress and become a law notwithstanding the President's veto. The same or similar power is conferred on the executive in the Constitutions of most of the States, also on the mayors of some cities, but in some cases only a simple majority is necessary to pass a bill over the veto. In England the sovereign's veto of an act of Parliament is absolute; but the prerogative has not been exercised since 1707, in the reign of Queen Anne, and then but once. In all the representative governments of Europe the executive veto power exists in forms more or less qualified by constitutional limitations. Both the term and the right are commonly traced back to the power vested in the tribunes of the people in ancient Rome to nullify any senatorial or other measures which they deemed injurious to their order or to the welfare of the people, which is said sometimes to have been done by pronouncing the word *veto*, "I forbid."

Virtue* is distinctively human; we do not predicate it of God. *Morality* is conformity to the moral law in action, whether in matters concerning ourselves or others, whether with or without right principle. *Honesty* and *probity* are used especially of one's relations to his fellow men, *probity* being to *honesty* much what *virtue* is to *goodness; probity* is *honesty* tried and proved, especially in those things that are beyond the reach of legal requirement; above the commercial sense, *honesty* may be applied to the highest truthfulness of the soul to and with itself and its Maker. *Integrity,* in the full sense, is moral wholeness without a flaw; when used, as it often is, of contracts and dealings, it has reference to inherent character and principle, and denotes much more than superficial or conventional *honesty. Honor* is a lofty *honesty* that scorns fraud or wrong as base and unworthy of itself. *Purity* is freedom from all admixture, especially of that which debases; it is *chastity* both of heart and life, but of the life because from the heart. *Duty,* the rendering of what is due to any person or in any relation, is, in this connection, the fulfilment of moral obligation. *Rectitude* and *righteousness* denote conformity to the standard of right, whether in heart or act; *righteousness* is used especially in the religious sense. *Uprightness* refers especially to conduct. *Virtuousness* is a quality of the soul or of action; in the latter sense it is the essence of virtuous action. voice, *n.* **1.** The sound produced by the vocal organs of a person or animal, especially of human beings; also, the quality or character of such sound; as, the *voice* of a sluggard; I knew her *voice*; a loud *voice*.

The voice is produced by the expulsion of a blast of air from the lungs through a slit-like opening, the glottis, formed in the larynx by the approximation of two membranes whose edges are termed the vocal cords. (See illus. under LARYNX.) Vibrations of these edges conveyed to the air above in the resonant cavities of the throat and head, produce sound. Variations in *loudness* arise by varying the intensity of the blast; in *pitch*, by changing the length, thickness, elasticity, and tension of the cords, thus affecting the number of vibrations per second; in *quality* or *timbre*, by the overtones caused by different shapes, sizes, and characters of the resonant cavities. The voice as used in speech varies but little in pitch, but is affected by altering the shape of the resonant cavities and by various noises (consonantal sounds) produced by the contact of the breath with the lips, tongue, teeth, palate, etc. In singing the pitch is definitely regulated so as to produce notes correlated according to their rates of vibration into scales, diatonic and chromatic. The *compass* or variation of pitch of a single human voice is usually somewhat more than two octaves, but cases have been known in which a compass of three octaves or even more has been attained. The extreme compass possible to all varieties of voice is a little over five octaves. Certain adjustments of the organs for definite ranges of pitch are termed the *registers*. The normal and natural one is the *chest*-register or **chest-voice**; a middle and an upper register are also recognized, the latter being also termed a **head-voice** or *falsetto*. When the vocal organs are arranged for a particular register, the different notes appear to be produced by a variation of tension of the cords and an approximation of their edges; and when the highest note that can be readily produced by that adjustment is reached, a new adjustment is made and the register thus changed. In the upper register some portions of the cords are usually approximated, thereby shortening the vibrating part. Animals without lungs do not have proper voice. Vocal organs first appear among the tailless amphibians (frogs, toads, etc.).

8. *Phon.* Sound produced by the action of the breath on the vocal cords; a sonant sound: distinguished from *breath* or *whisper*. **9.** *Gram.* (1) The relation of the subject of a verb to the action which the verb expresses — that is, the relation of the subject as acting, acting upon or for itself, or as acted upon. (2) Hence, the form of a verb (as modified by inflection or auxiliaries) that expresses or indicates the relation of the subject to the action affirmed by the verb. (3) Collectively, the various verb-forms, as so modified, arranged in a systematic way as regards mode, tense, number, person, etc. (4) So much of the conjugation of a verb as shows a single relation of the subject to the action expressed by the verb; as, a paradigm of the passive *voice* of "to love."

English grammarians give conjugation for two voices, the **active** and **passive** (which see). With them the **passive voice** is formed with the past participle, and some part of the substantive verb *to be*. The **active voice** has two forms: one comprising the simple inflected forms of the verb with auxiliaries not parts of *to be*; the other, called *progressive*, adding the present participle to some part of the verb *to be*. In Greek and Sanskrit there is a third voice called **middle** (see phrases below).

The fluid does not rotate in mass as a solid body, but has unequal angular velocities at different points. In vortices seen in nature, the axis of the vortex is usually a closed curve, as in the smoke-rings puffed from a locomotive, a cannon-mouth, or a smoker's lips. These circular vortices or vortex-rings move forward parallel to the same plane, the parts rotating about the circular core but the ring not rotating about its axis. If two circular vortices approach each other, one expands, rotates more slowly, and the other contracts, rotates more rapidly, and passes through the center of the larger ring without touching it. In a perfect fluid a vortex could not be formed by mechanical means, but if it existed it would be indestructible, whatever changes of shape it passed through. See VORTEX-ATOM.

A new epoch in the progress of hydrodynamics was created, in 1856, by Helmholtz, who worked out remarkable properties of rotational motion in a homogeneous, incompressible fluid, devoid of viscosity. He showed that the *vortex* filaments in such a medium may possess any number of knottings and twistings, but are either endless or the ends are in the free surface of the medium; they are indivisible. These results suggested to Sir William Thomson the possibility of founding on them a new form of the atomic theory, according to which every atom is a *vortex* ring in a non-frictional ether, and as such must be absolutely permanent in substance and duration. vow'el, *n.* A sound or tone produced by the vibrations of the vocal cords; an open sound as opposed to a closed, stopped, mute, or consonant sound.

Philologists distinguish three primitive vowels, *a, i, u,* from which the remaining Aryan vowel-system is developed. Thus the union of *a* and *i* produces *ai* or *e,* the union of *a* and *u* produces *au* or *o,* etc. Vowels are long or short, simple or compound (diphthongs, digraphs, etc.), and a certain class of them have a semiconsonant character, as *i* and *u* (*j, y, w, i, u*), while some consonants, as *l, n, r,* have in some languages (as in English) vowel-value in certain relations. See SEMIVOWEL.

The letters a, e, i, o, u were originally devised and intended to represent the *vowel*-sounds in far, prey, pique, pole, and rule, respectively, and they still have those values, constantly or prevailingly, in most of the other languages which employ them. . . . Our written *vowels* have from three to nine values each, and they are supplemented in use by a host of digraphs, of equally variable pronunciation. W. D. WHITNEY *Lang. and Study of Lang.* lect. iii, p. 94. [S. '67.]

Every suffix has two forms, a light and a heavy, used as circumstances require.—**neutral v.,** the sound as of the *u* in *tub, turn, burn, son,* which is especially found in unaccented syllables and is an obscure form of some more distinct vowel. The letter *e* often has this pronunciation.—**vow'el-gra-da'tion,** *n.* *Philol.* The change of vowel upon which the classification of strong verbs is based; as, *drink, drank, drunk;* ablaut as distinguished from umlaut. Ablaut is an effect of accent, umlaut of assimilation. Anglo-Saxon roots in *a* have three different systems of accent, whence three ablaut conjugations; roots in *i* and in *u* have each but one, so that there are five ablaut conjugations. Verbs are, however, modified by various umlauts, and grammarians often distinguish conjugations by them, and enumerate from six to twenty of them.—**v.-mutation,** *n.* *Philol.* Same as UMLAUT.—**v.-point,** *n.* One of a system of diacritical marks written in connection with consonants in Hebrew and certain other Oriental languages to indicate the vowel sound to be given with such consonant.

The use of such terms is defensible only when no better terms can be found.—**vox consequens,** the answering part of a canon or fugue.—**vox humana,** a reed-stop for producing in an organ tones that resemble the human voice: usually having short, capped pipes, rich in the higher harmonics, and aided in effect by a tremolo.—**vox populi,** the voice of the people; public sentiment, especially when declared, as at the polls.—**vox quinta** (*Medieval Mus.*), the fifth part. W

W w Roman. 𝔚 𝔴 Black Letter. *W w* Script.

W, w, dub'l-yū, *n.* [w's, W's, or Ws, dub'l-yūz, *pl.*] **1.** A letter: the twenty-third in the English alphabet; in Bell's "Visible Speech," Ↄ: the sign of bilabial consonant movement made vocal by *u* sound, opening as in *woo, we*, closing unrecognized in standard English as in *low, few*. It is called a semivowel, sonant, voiced, continuous labial; sometimes, a fricative.

The mouth having been rounded for *u* (see U), and the lips constricted, they open with *u* resonance upon the following vowel. The special constriction and opening are necessary to produce *w* before *ū*, as in *woo* = wū; but before other vowels a simple unrounding and opening from *u* produces the consonantal effect; *ua, ui, uo* closely resemble *wa, wi, wo*.

wh. If the vocal cords are not closed so as to vibrate when the *w* movements are made, sund breath will be blown into the *n* chamber and a surd *w*, Visible Speech Ↄ, will be made. This is often preceded by *h*, as in *white* = hwait, *when* = hwen; but also occurs after other surds, as *q, s, t*; *quart* = cwert, *sweet, twin*.

The modern English *w*'s almost all come from Anglo-Saxon; the sound occurs also with the *u* of some words from Latin and French, and the *o* of French words in *ot.* *quart, suitably, reservoir*. See further under Q.

The consonant *u* or *w* sound has appeared freely and passed away strikingly in the Indo-European tongues. No record of the Greek *w* or digamma, so well known to philologists, is found in the manuscripts of literature. The *w* of Latin was written with the same letter as the vowel *u, v*. In the second century A. D it changed into the spirant *v*, and so continues through the Romanic tongues. The Scandinavian and Old High German also began with *v* = *w* abundant, which has now become a spirant. Anglo-Saxon preserves the original sound, but many words have lost it: (1) initial before *r*, as in *write, wrong;* before *l*, as in *wisp* < *lisp*. (2) medial sometimes in *thew, toe, sue*, as in *thong* < As. *thwang, two* = tū, *answer, sword*; (3) final *w* has changed to its vowel or dropped in sound entirely; *few* = fū, *sparrow* > *sparrow, tooth* > *true*. The Normans could not pronounce German *w* easily, but substituted *gu, r, u, qu*: *guerre* (*war*) > *querrilla*. There was confusion about *h* and *w*, the AS. *hu* was turned over: *hwat* > *what*; and silent *w* was written by blunder, as *whole* for *hole*. W easily changing to *u*, and, combining freely with other letters, is concerned in many phonetic changes, especially in classic Latin, such as *v* > *u* in *votre, solution*, and *wa, ua*, > wa, *o* in English *was, sauce*.

The *w*'s average 2.31 per cent. of the sounds on the pages of English literature, according to Professor Whitney's examination. W. D Whitney *Oriental and Linguistic Studies* second series, p. 274 (s. '74).

W is a ligature of VV. For earlier history of V, see its vocabulary place. V, then the sign of the vowel *u*, came into use, single and double, in England for consonant *u* = w, through Anglo-Norman influence, 1150–1280. The v's are at first written separate or sometimes ligatured, VV. The earliest Anglo-Saxon, like Old High German, makes the same use of u, v, uu, vv, vu. But from the ninth century to 1280 a special Anglo-Saxon character was used, Ƿ < runic ᚹ, *wēn*, hope, and *wyn*, joy, the eighth letter of the futhorc < early Greek Ϝ.

The two u's or o's were naturally spoken of as "double u" and *o* as "single *o*," and although *wi, we*, and *wan* were early proposed as names for the new ligature, no phonetic name has gained currency. The French call it *double v*, the Germans *we*. For further details, see F, U, V, Y.

walk, *n.* **1.** The primitive method of locomotion used by the terrestrial vertebrates on their development, effected by a uniform system of limb-movements common alike to quadrupeds and bipeds, the law governing the motion being that in regular and consecutive action the superior limb precedes its lateral inferior limb: it is the usual gait of nearly all animals when speed is not exercised.

If, in the quadrupedal walk, the notation begins with the landing of a right hind foot, the consecutive foot-fallings will be the right fore foot, the left hind foot, the left fore foot, followed by its diagonal hind, with which the record began. The time-intervals of foot-fallings vary with different species of animals, but their sequence is invariably the same except with the ape family, in which the sequence is reversed unless under exceptional circumstances, a fore foot preceding the landing of its lateral hind foot. During a single stride of a quadruped in an ordinary walk it is supported in eight different ways: twice on the laterals, twice on the diagonals, twice on two hind feet and one fore foot, and twice on two fore feet and one hind foot. See plate of MOVEMENTS OF THE HORSE, at MOVEMENT.

It is thus seen that when a horse during a *walk* is on two feet, and the other two feet are suspended between the supporting legs, the suspended feet are laterals. On the other hand, when the suspended feet are severally in advance of and behind the supporting legs, they are diagonals. These invariable rules seem to be neglected or entirely ignored by many of the most eminent animal-painters of modern times. EADWEARD MUYBRIDGE *On the Science of Animal Locomotion* p. 8. [R. I. GT. BRIT.]

The Parts of an American Open-face Watch.

I. View showing lower plate (top plate removed), main-wheel (broken out to show mainspring), time-train, escapement, balance-wheel, and hair-spring; also shifting mechanism for winding and setting. II. View showing back side of lower or pillar plate (dial removed to show hour- and minute-wheels, etc.). III. View showing barrel-bridge and train-bridge (which together compose the top plate), winding-wheels, balance-cock, regulator, etc. IV. Sectional view through centers of train.

In operation, turning winding-bar (68) carries winding-pinion (69), which meshes into and drives crown-wheel (8), which engages winding-wheel (10), made fast to barrel-arbor (15), which, turning, carries mainspring-barrel (19), to which is attached outer end of mainspring (17), and winds up mainspring, which is prevented from unwinding by click (76). Inner end of mainspring being connected to hub of main-wheel (13) causes it to turn, and in so doing to drive center-pinion (24), on which is fixed center-wheel (25), which drives third pinion (32) and third wheel (31). This in turn drives fourth pinion (34) and fourth wheel (33), which drives escape-pinion (37) and escape-wheel (36). A tooth of escape-wheel, bearing against pallet-jewel (40), swings pallet (38), an extended arm of which terminates in a fork, which in moving carries enclosed roller-jewel (46) and roller (45), which, being fast on balance-staff (50), turns balance-wheel (48), giving it a slight impetus, and in so doing deflects hair-spring (53) until its resistance exactly equals momentum of balance. The spring then reacts, carrying balance in opposite direction, until roller-jewel reenters the fork and moves it sufficiently to unlock the escape-wheel, which then imparts another impulse to balance as before, each tooth of the escape-wheel giving an impulse to carry the balance in one direction, when acting on one side or arm of the pallet, and in the opposite direction when acting on the other pallet-arm. The weight of balance and strength of hair-spring, when properly related, serve to regulate the frequency of the balance-vibrations to 18,000 in one hour. The relation of the wheels and pinions of the several members of the train is such that the above rate allows the fourth pinion to revolve once each minute, carrying the second-hand (35). The center-pinion revolves once each hour. On this pinion is placed, friction-tight, the cannon-pinion (25), on which is the minute-hand (30); the cannon-pinion drives minute-wheel (28), fast to which is the minute-pinion, which drives the hour-wheel (27), which fits freely on body of cannon-pinion, and carries hour-hand (29), which makes its circuit once in twelve hours.

Pure water is neither alkaline nor acid, and is free from odor and taste. It is blue when viewed in mass, but water of other colors caused by foreign matters, organic or inorganic, is not of uncommon occurrence; even water that is as white as milk or black as ink is known. It becomes solid at 32° Fahr., forming ice, and at 212° Fahr. it becomes gaseous, forming steam at the normal pressure of the air. Its greatest or maximum density is at 39.2° Fahr., which is called unity (1.00) and is the standard for the comparison of the densities of other solids and liquids. A cubic centimeter of water at 39.2° Fahr. weighs 1 gram and is the standard unit of the metric system. It is an imperfect conductor of electricity and is slightly compressible. The solvent powers of water are very great, and it is seldom found pure. Among geological agencies it is first both as regards its mechanical and chemical action. It is the chief agency in rock-making, in shaping mountains, excavating valleys, and in recording the progress of the earth in its features and life. Its mechanical action manifests itself by softening rocks and earthy beds by penetrating and causing disintegration through alternate freezing and melting, while its chemical action manifests itself by its solvent power, yielding new minerals while altering others. Water forms more than two-thirds of the earth's surface, and it has been estimated that if all the water of the globe could be collected it would form a sphere 900 miles in diameter. According to its source, it is known as **river-water, sea-w., spring-w.**, etc. When precipitated from the clouds it is **rain-w.** Water is also an essential constituent of all animal and vegetable life, and of most minerals and rocks, forming the so-called *water of crystallization*. [See phrase.] It frequently imparts crystalline form and color to salts, as in the case of cobalt, copper, iron, and other sulfates.

> Of course without an atmosphere there can be no *water*, since the *water* would immediately evaporate and form an atmosphere of *water* vapor. . . . It is not impossible, however, or even improbable, that solid *water*, that is, ice and snow, may exist on the moon's surface.

wave[3]†, *imp.* of WEAVE, *v.*

wave, *n.* **1.** A ridge of liquid, usually advancing, though the particles that compose it either do not advance with it at all or not at the same rate, but have a movement of oscillation, usually in a closed curve; especially, a large ridge of this kind where the oscillatory force is gravity, as opposed to a *ripple*, where it is surface-tension. Ocean-waves are caused chiefly by the wind. On reaching shallow water the lower part is retarded by friction, and the crest curls over and breaks into foam. Waves thus breaking on coasts have been potent agents in erosion through geologic history.

A Wave in Water, showing motion of particles.

The figures show the wave in four successive stages of its motion from left to right. The black dots show actual positions of particles; the light dots the positions of rest from which they started. Each particle on the surface describes a circle clockwise, as the wave progresses, as shown in the diagram, but the particles do not progress with the wave.

When *waves* start in deep sea they are often thirty or forty feet in height . . . and have a width of a thousand feet or more.
N. S. SHALER in *The Chautauquan* Feb., '90, p. 548.

2. *Physics.* A disturbance of the equilibrium of a body or medium, which is propagated from point to point with a continuous motion, each particle only vibrating on each side of its position of equilibrium, while each phase of vibration moves onward; by extension, a stationary vibration (see STATIONARY): applied also to disturbances of electrical equilibrium, etc., similarly propagated.

The most important waves are (1) those on the free surface of a liquid (see def. 1), where the force of oscillation is either gravity or surface-tension, the particles generally moving in curves whose plane contains the direction of propagation of the wave, and the resulting form being a series of alternate ridges and troughs; and (2) those that travel through the body of an elastic medium, where the force is that of elasticity, including (*a*) waves where the particles oscillate in the same direction as the motion of the wave, the resulting form being a series of condensations and rarefactions, as in the case of sound (see SOUND-WAVE), and (*b*) waves where the particles oscillate at right angles to the direction of propagation, the resulting form being a more or less complex distortion in the substance of the medium, as in the case of light-waves in the ether. The character of a wave is determined by its *wave-length, velocity, frequency*, and *phase*. See these words. The velocity of a wave in the body of a medium depends on the elasticity and density of the medium.

3. One of the rising curves on an undulatory edge or surface; one of the curves in any series of curves; as, the *waves* upon a furrowed field. **4.** Something that comes, like a wave, with a great volume or power; a flood; tide.

The week has been in use in Eastern countries since prehistoric times, but was not introduced into the Roman calendar till after the reign of Theodosius (4th century A. D.). The present names of the days of the week are astrological in their origin, the hours being allotted to the seven planets in the order of their supposed distances from the earth, and each planet being regarded as presiding over the day whose first hour belonged to it. Thus, the days of the Roman week were assigned in order to the sun, the moon, Mars, Mercury, Jupiter, Venus, and Saturn. The Latin nations have retained the names derived from these deities, but in the Germanic languages they are replaced by names derived from those of the corresponding Germanic deities, Tiw or Tyr being regarded as the equivalent of Mars, Woden of Mercury, Thor of Jupiter, and Freya of Venus. The society of Friends name the days by their numbers, beginning with Sunday, as *First-day, Second-day*, etc. See the names of the days of the week in vocabulary.

weigh'ing, wē'ing, *n.* **1.** The act of determining weight. **2.** The quantity of a commodity weighed at one time; as, a *weighing* of lard.

—**weigh'ing-cage"**, *n.* A cage for weighing living animals. —**w.-head**, *n.* The fixed head of a hydraulic testing-machine, containing a water-chamber to which the pressure is applied. —**w.-house**, *n.* Same as WEIGH-HOUSE. —**w.-machine**, *n.* Any apparatus for ascertaining weight; especially, an apparatus for weighing very heavy bodies, as loaded wagons, cars, bales, etc. —**w.-scale**, *n.* A scale for finding the weight of any object. —**w.-scoop**, *n.* A scoop having a spring-balance in the handle, so that when the spring is released the weight of the contents of the scoop is indicated on its graduated handle.

weight, wēt, *vt.* **1.** To add weight to; put a load upon; figuratively, to burden; as, the horse is sufficiently *weighted*; he *weights* himself with care. **2.** To adulterate or load (fabrics or other merchandise) with cheap foreign substances; as, if the importer *weights* his teas, the dyer also *weights* his fabrics. **3.** In founding, to place weights upon (the upper box of a flask), to prevent the parts from separating by pressure of molten metal. **4.** In scientific observations, to assign to (an observation) a number that is supposed to express its relative value.

weight, *n.* **1.** The measure of the force with which bodies tend toward the earth's center, or the quality thus measured; downward pressure due to gravity diminished by the centrifugal force due to the earth's rotation; ponderosity.

Weight varies directly as the mass of a body and as the force of gravity. As the mass of a given body is invariable, that body always weighs the same at the same place under uniform conditions; but as the force of gravity is different for different places (see STANDARD GRAVITY, under GRAVITY), change of position involves change of weight, though the change is too small to be taken into account in commercial transactions. The weight of any body is increased about $\frac{1}{189}$ by removal from the equator to the poles. The apparent weight depends also upon the surrounding medium, the supporting influence of this being greater the greater its density, so that a body weighs less in water than in air. In stating weights, scientific accuracy requires a statement of the exact latitude, altitude, barometric pressure, temperature, and other conditions. Compare note under MASS, 5.

2. A definite mass of brass, iron, or other metal used in weighing-machines of various sorts as a standard, as a pound, ounce, etc. **3.** Any quantity of heaviness, whether expressed indefinitely or in terms of standard units; also, mass: relative quantity of matter.

Weight is used in compounds by sporting men. See **bantam-weight**; **catch-w.**; **featherweight**; **heavy-weight**; **middleweight**; **welter-w.**

4. Any mass used as a counterpoise or to exert pressure or force by gravity; as, a paper-*weight*; clock-*weight*. **5.** A scale or graduated system of standard units of weight; as, avoirdupois *weight*; troy *weight*.

Three systems are in common use—**avoirdupois, apothecaries'**, and **troy** weights—having the *grain* common to them. The ounce and pound are alike in apothecaries' and troy weights, and in avoirdupois the ounce is less but the pound is a little more than one-fifth greater, or as 7,000 to 5,760. The lower denominations are: in avoirdupois, the *dram;* in apothecaries', the *scruple* and *dram;* in troy, the *carat* and *pennyweight*. For specific values of weights in each class, see table. See also METRIC SYSTEM.

6. The relative tendency of any mass toward a center of superior force; as, the *weight* of a planet or satellite. **7.** Figuratively, the quality of possessing due efficacy; impressiveness; importance; especially, superior efficacy or preponderance, as of proof in establishing a conclusion; as, a man of *weight;* the *weight* of evidence is against him. **8.** A feeling of oppressiveness, mental or otherwise; as, the *weight* of care; a feeling of *weight* in one's head. **9.** In mining, the sinking of the roof due to removal of its natural support. **10.** [Archaic.] The resistance to be overcome by a machine in working, or its load; with simple mechanical powers, the mass to be moved or suspended. [< AS. *gewihť*, < *wegan*, lift.] **waight**†; **wight**†.

Synonyms: burden, efficacy, gravity, heaviness, import,

load, moment, ponderosity, ponderousness, power, pressure. See INFLUENCE; LOAD.

—**lazy weight**, scant weight.—**molecular w.**, the weight of a molecule, referred to hydrogen as a standard.—**weight'-nail"**, *n.* In ship-building, a nail heavier than a deck-nail and with a flat head.—**w. of an observation**, in scientific observations, a number expressing the relative value or importance of an observation, and inversely proportional to the square of its probable error.—**w. of a reciprocant** (*Math.*), the sum of the orders, each diminished by two, of the factors of the term having the greatest weight.—**w. of metal**, the weight of projectiles that can be thrown in a single discharge of all the guns of a vessel.—**w. of wind**, the pressure of air supplied to an organ-stop, or group of stops, by the bellows.—**w.-rest**, *n.* A lathe-rest held on the ways by a weight suspended beneath.

The following table and notes exhibit current weights in use throughout the world, and historic weights, useful for reference, together with some disused modern weights and some of medieval times. The superior figures used in the table indicate that further information is given in the notes appended. Comparatively unfamiliar variant names will be found only in the notes, at the number corresponding with that appended to the tabulated name. In the column of national equivalents, exact fractions have often been replaced by simpler ones that are nearly equivalent, but the figures in the fifth and sixth columns and in the notes are exact, according to the best available authorities, except that metrical equivalents have been given only to two places of decimals. Authorities differ as to exact values in metrical equivalents beyond the decimal point. Some variations will therefore be found, but hardly ever exceeding three-hundredths.

weld¹, weld, *v.* **1.** *t.* **1.** To unite, as heated metal, in one piece or mass under the hammer or by pressure; consolidate, as separate masses, into one.

> Metals are weldable in proportion to the length of time they will stay under heat in a plastic condition without melting. Steel welds at a lower temperature than iron. The process usually consists in bringing a tapered end of each piece to a white heat, fluxing them with a welding-powder, and then closing or shutting the surfaces with hammers on an anvil. In **pipe-welding**, a skelp or iron plate is formed into a tube by joining the edges, and drawing at white heat through a pair of bell-mouthed jaws. In **electric welding**, two ends may be pressed together while heated by an electric current to the welding-point, the heat being concentrated at the seam by the great resistance there. Horn may be welded by joining the parts, incased in wet linen cloth or immersed in hot water, and bringing their lapped edges under the pressure of heated plates of iron. Graphite and coal may be welded by pressure alone.

Wells vary in size from pits 15 to 20 feet in diameter to mere borings. (Compare DRIVEN WELL.) They are generally cylindrical and lined with brick, tubing, or some other facing, to prevent the sides from falling in or the infiltration of other products than those sought. The liquid or gas is delivered at the surface either by natural underground pressure, as in Artesian wells and gas-wells, or by such devices as a bucket and pulley or sweep, a bucket and windlass, an endless chain with disks or other devices, or a pump. The use of wells as a means of water-supply is of great antiquity. Wheat (*Triticum sativum*).

1. An ear of bearded wheat. 2. An ear of beardless wheat. 3. Front (*a*) and back (*b*) views of a grain of beardless wheat.

The matured fruit of each productive flower, called a *caryopsis* or *grain*, is hard, seed-like, and longitudinally grooved like the corresponding fruits of rye and barley. The origin of the plant is lost in antiquity. Wheat is known as **bearded, beardless,** or **bald,** according to the presence or absence of the awns or beard: as **white, red,** or **amber,** according to color; and as **spring, summer, fall,** or **winter,** according to the time of planting, the last two terms signifying that the grain is sown the year before that in which it matures, and the first two that it is sown in the same year. Among cultivated varieties of wheat the following are the more important: (1) **Dwarf** or **hedgehog wheat** (*T. sativum*, var. *compactum*, *T. compactum* of authors), with awned or awnless spikes 3 to 4 times longer than broad, and rigidly upright culms: at present cultivated in the Austrian Alps, Alsace, Switzerland, Chile, and Turkestan. (2) **English w.** (*T. sativum*, var. *turgidum*, *T. turgidum* of Linnæus), with tall, stiff, and upright culms and thick, four-sided spikes: cultivated in the Mediterranean countries, more rarely in England and Germany. (3) **Hard** or **flint w.** (*T. sativum*, var. *durum*, *T. durum* of Desfontaines), with pithy or frequently solid culms and long bristling awns: cultivated in Mediterranean countries, and the most important grain in Spain. (4) **Polish w.** (*T. Polonicum*), with large compressed, mostly bluish-green spikes: extensively cultivated in Spain and to some extent in Italy and Abyssinia. Various forms of wheat falling under this or some other classification are given below.

The uses of wheels are as various as the modifications in form made to meet such requirements, the only features universally characteristic being rotation (partial or entire), motion (continuous, oscillatory, or intermittent), and a contour that is circular or nearly so. When the edges are toothed, for engagement as with a rack, the wheel is called a *gear*; if of elliptical shape, a *cam*. Compare WHEEL AND AXLE, below, and WATER-WHEEL.

Vehicle-wheels are commonly made (1) of wood, with a hub strengthened by bands, and a metallic box or bushing for the axle-skein, the spokes being mortised into the hub and tenoned into the rim or felly, the whole being strengthened by a metal tire; (2) of iron or steel, either cast in one piece or having a metal hub connected by plates with a rim; (3) with a light rim connected with the hub by wire spokes, as in modern cycles and some other vehicles: a form in which the weight of the vehicle is supported by the tension of the spokes.

whist[2], *n.* **A game of cards played by four persons, with** a full pack of 52 cards, opposite players being partners.

All the cards are used and played in each hand, and there are thus 13 tricks, each of which is taken by the highest card played, it being obligatory to follow suit if possible. Every trick above the sixth counts one point, and when honors (the four highest trumps) are scored each one of these held by one side in excess of the other scores a point. In **American** or **standard whist** honors are not scored and the game is seven points. In **short whist** the game is five points; in **long whist** (the old form, now unusual), ten points. Whist is generally regarded as the most scientific game of cards, and the rules and principles of play have been exhaustively treated of by many writers.

The first known mention of *Whist* in print was in a book called 'The Motto,' published in 1621, where it is spelled *Whisk*. The earliest known use of the present spelling is in Butler's 'Hudibras,' 1663. For about fifty years after this it was spelled indifferently either way . . . The game was much studied by a party of gentlemen who frequented the Crown Coffee House in London in 1730, and then it began to be played in its modern form.

Called also **Kalamazoo whist**, from the town in Michigan where it is said to have originated. — **fancy w.**, whist introducing strange or unauthorized plays. — **mongrel w.**, whist played according to more than one method.

The object is commonly a clause beginning with *that*. will, wil, *n.* **1.** The power of willing. Specifically: (1) The power of conscious, especially of deliberate, action.

We define *Will* to be that power of the soul by which it intentionally originates an act or state of being. D. D. WHEDON *Freedom of the Will* pt. 1, ch. 1, p. 15. [CA. & P. '64.]

Will is to be distinguished from the unreasoning spontaneous activity of mind and body inherent in animal organism, and covered by the word *impetus* in the sense of an impelling or stimulating to one or another form of activity, as in the immediate response of mind and body to emotion, association, habit, instinct, or any nervous excitation, and observable even in sleep.

(2) *Psychol.* The faculty by which the rational mind makes choice of its ends of action, determines to act in view of a certain (mentally represented) end or in a certain way or to refrain from action, and directs the energies in carrying out its determinations: one of the three fundamental powers of the mind; will proper. See MIND. The elements of will are (*a*) *choice*, (*b*) *purpose*, and (*c*) executive or directive *volition*. See these words. It involves, as its conditions, intellectual action in deliberation, planning, etc., and emotional activity, in affection, desire, etc.

The determination of the *will* means nothing but the same person acting. The assertion, that the motive determines the *will*, therefore, is only an abstract statement of the fact, that the man wishing determines the man acting, or that the *will* determines itself, — which is precisely the theory of the advocate for human freedom. F. BOWEN *Metaph. and Eth. Science* pt. i, ch. 5, p. 122. [H. S. & S. '75.]

As a being with a *will*, man cannot avoid putting before him certain aims and principles of conduct.
BOSANQUET *Hist. of Æsthetic* ch. 10, p. 250. [MACM. '92.]

Force becomes known to us partly through the sense of effort and resistance overcome which attends our muscular activity, and partly through the exercise of *will*, as perceived in exerting our voluntary mental activity — force of mind being a term of familiar use as well as force of arm. MIVART *Essays and Criticisms* vol. ii, ch. 7, p. 227. [O. & CO. '92.]

(3) In loose and popular use, any one of the constituent elements of the power of willing: choice, purpose, or directive effort; as, the man's *will* is right, only his action is wrong. (4) The active or motive powers (embracing feeling and will proper), as distinguished from the intellectual or cognitive powers; the entire active aspect of mental life: wider than *conation*, as embracing all the emotions. Compare VOLUNTARY, *a.*, 1 (3).

The division of the faculties of the human mind into Understanding and *Will* is very ancient, and has been very generally adopted, the former comprehending all our speculative, the latter all our active powers. REID *Works* vol. ii, intro., p. 77. [T. T. '63.]

(5) In the philosophy of Schopenhauer, the active or causal efficiencies of the universe, embracing will proper, conscious desire, unconscious instinct, and the forces manifesting themselves in inorganic nature: essentially a pantheistic conception.

6. [Archaic.] A conscious inclination or desire toward any end or course; a wish; as, his *will* at that time was to marry; cherish good *will* for all. **7.** *Law.* An instrument by which a person makes a disposition of his property to take effect after his death; the legal declaration of a man's intentions that he wills to be performed after his death.

Formerly the word *testament* was specifically applied to the disposition of personal property, while *will* was applied to the devise of real property; but it is now usual to refer to the instrument generally as a *last will and testament*. If a person has made more than one will, the one last made operates to revoke all others and stands as the testator's only will. The formalities essential to the lawful execution of a will vary in different jurisdictions, but generally the instrument must be signed, and in some instances sealed, by the testator, and declared by him to be his last will in the presence of at least two and in some cases three witnesses, who must subscribe the instrument in his presence and in the presence of each other. The general doctrine of international law is that wills concerning lands must be executed according to the prescribed formalities of the state in which the land is situated; but wills of chattels executed according to the laws of the place of the testator's domicile will pass personal property in all other countries. KENT *Comm.* vol. iv, p. 513.

Its efficacy depends on its declaring the testator's intention, whence . . . it is emphatically styled his *will*.
BLACKSTONE *Commentaries* bk. ii, p. 500.

8. [Archaic.] A request or command; an expressed wish; as, send me your *will* by letter, and it shall be done. — \ \ *willa*, < *willan*, will.]

Synonyms: choice, decision, desire, determination, disposition, intention, resolution, volition, wish. *Will* is a word of wide range of meaning, and both as faculty and act has been the subject of many and various theories; in popular language *will* is often equivalent to *desire* or *intention*, as when we speak of doing something against our *will*. *Volition* is a word of scientific precision, denoting the determinative element of *will*.

Phrases: — **antecedent will**, the determination to do something provided some antecedent condition be realized; a conditional resolution. — **at w.** **1.** At pleasure or discretion. **2**†. Under complete command; as, to have one's vocabulary *at will*. — **freedom of the w.** **1.** *Philos.* (1) The possession and exercise of rational freedom. See FREEDOM, 6. Freedom of the will has been variously regarded and defined, (*a*) some holding that freedom proper consists of choice only as between higher and lower good; (*b*) some regarding it as consisting in the power to do as one pleases or chooses; (*c*) others defining it to be the power to choose or please as one should. (2) According to some, the power of deciding and acting in a manner contrary to any and to all of one's own motives, inclinations, or tendencies: said to be inherent in the will. The controversies concerning freedom of the will have led to the distinction and formulation of three theories regarding the relation of motive to will or volition, holding respectively that it is the relation of: (*a*) Cause and effect. Compare FATALISM; NECESSARIANISM; DETERMINISM, 1 (1). (*b*) Succession in time, the causal relation being excluded in order to secure freedom, and all free action being unmotived: the theory of indifference. (*c*) Reason and consequent: involving the recognition of the fact and activity of man's rational nature, while acknowledging his limitations, and looking upon his free action as the joint result of character and circumstances. They vary in size from trees of 60 feet in height to shrubs of only a few inches, and have generally smooth branches and often long, slender, pliant, and sometimes pendent branchlets. The slender and pliant branchlets, or osiers, have been used from the earliest time for basketwork, and in the days of Pliny they were twisted into ropes, as they still are in northern Europe. In parts of Europe the leaves of some species have been used for fodder. Some species furnish excellent timber, and valuable wood for gunpowder-charcoal, while the bark of some species is very rich in tannin. **2.** [Colloq.] Something made of willow, especially a baseball- or cricket-bat; as, a player handy with the *willow*.
